

On the Subject of Color Hexagons

It was either that name or Color Generator 2.

In the diagram below you can find the row of 6 hexadecimal digits found on the hexagonal buttons on the module. To defuse the module, find this row and press the button where the color of the button matches the color in the diagram. If an incorrect button is pressed, a strike will be recorded and the module will not reset. Note that the digits should be read left to right, in a zigzag fashion.
